OList Delivery Performance Analysis

Analysis of 96,470 delivered orders across the Olist Brazilian e-commerce platform (2016-2018).

Key Findings:

- 91.9% on-time rate platform-wide, though delivery estimates are systematically conservative by ~12 days.
- When late, orders miss by an average of 8.9 days, with 345 orders delayed 30+ days.
- Northeastern states face nearly 4x the late rate of São Paolo (AL: 23.9% vs SP:5.9%)
- Seller-side late rates are significantly lower than customer-side rates. Delays are driven by logistics infrastructure gaps, not seller performance.
